Distributed System

THOAI NAM

- Distributed Systems
- □ Challenges
- □ Transparency
- Scalability
- Distributed OS

□ A distributed system:

- Multiple connected CPUs working together.
- Components located at networked computers comminicate and coordinate their actions only by message passing.
- A collection of independent computers that appears to its users as a single coherent system.
- Examples: networked machines, Internet, Intranet, mobile and ubiquitous computing

Advantages

- Communication and resource sharing possible
- Economics price-performance ratio
- Reliability, scalability
- Potential for incremental growth
- Disadvantages
 - Distribution-aware PLs, OSs and applications
 - Network connectivity essential
 - Security and privacy

- □ Heterogeneity
- Openness
- Security
- □ Scalability
- □ Failure handling
- □ Concurrency
- □ Transparency

Transparency	Description	
Access	Hide differences in data representation and how a resource is accessed	
Location	Hide where a resource is located	
Migration	Hide that a resource may move to another location	
Relocation	Hide that a resource may be moved to another location while in use	
Replication	Hide that a resource may have many copies	
Concurrency	Hide that a resource may be shared by several competitive users	
Failure	Hide the failure and recovery of a resource	
Persistence	Hide whether a (software) resource is in memory or on disk	

Different forms of transparency in a distributed system.

Concept	Example		
Centralized services	A single server for all users		
Centralized data	A single on-line telephone book		
Centralized algorithms	Doing routing based on complete information		

Examples of scalability limitations.

- □ Minicomputer model
 - Each user has local machine
 - Local processing but can fetch remote data (files, databases)
- Workstation model
 - Processing can also migrate
- Client-server Model
 - User has local workstation
 - Powerful workstations serve as servers (file, print, DB servers)
- □ Processor pool model
 - Terminals are Xterms or diskless terminals
 - Pool of backend processors handle processing

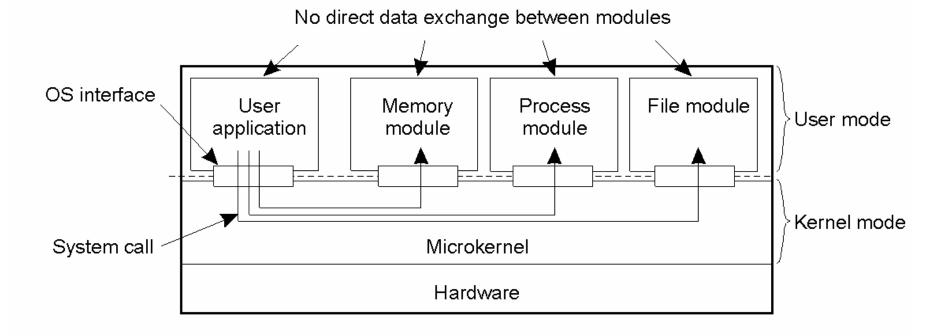

- An OS acts as a resource manager or an arbitrator
 - Manages CPU, I/O devices, memory
- OS provides a virtual interface that is easier to use than hardware
- □ Structure of uniprocessor operating systems
 - Monolithic (e.g., MS-DOS, early UNIX)
 - » One large kernel that handles everything
 - Layered design
 - » Functionality is decomposed into N layers
 - » Each layer uses services of layer N-1 and implements new service(s) for layer N+1

Microkernel architecture

- Small kernel
- user-level servers implement additional functionality

- □ Manages resources in a distributed system
 - Seamlessly and transparently to the user
- □ Looks to the user like a centralized OS
 - But operates on multiple independent CPUs
- Provides transparency
 - Location, migration, concurrency, replication,...
- □ Presents users with a virtual uniprocessor

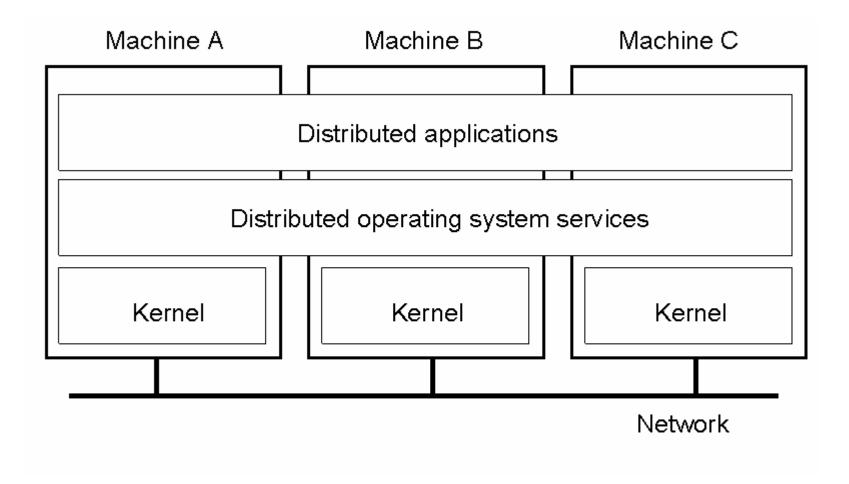

System	Description	Main Goal
DOS	Tightly-coupled operating system for multi-processors and homogeneous multicomputers	Hide and manage hardware resources
NOS	Loosely-coupled operating system for heterogeneous multicomputers (LAN and WAN)	Offer local services to remote clients
Middleware	Additional layer atop of NOS implementing general-purpose services	Provide distribution transparency

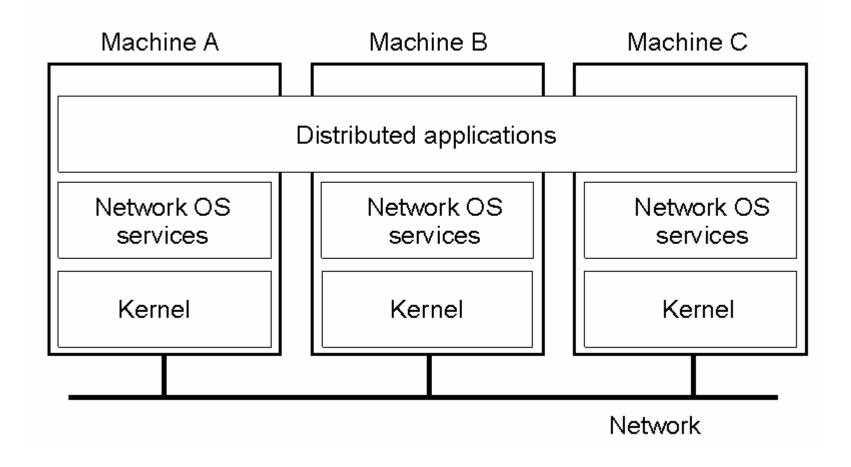

- □ Like a uniprocessor operating system
- □ Manages multiple CPUs transparently to the user
- □ Each processor has its own hardware cache
 - Maintain consistency of cached data

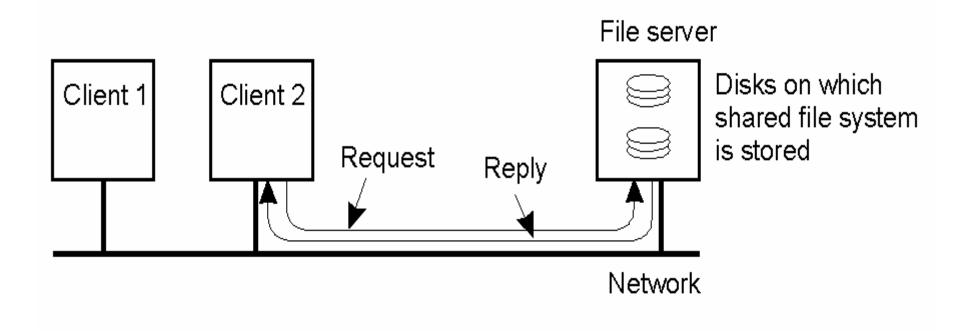

Khoa Công Nghệ Thông Tin – Đại Học Bách Khoa Tp.HCM

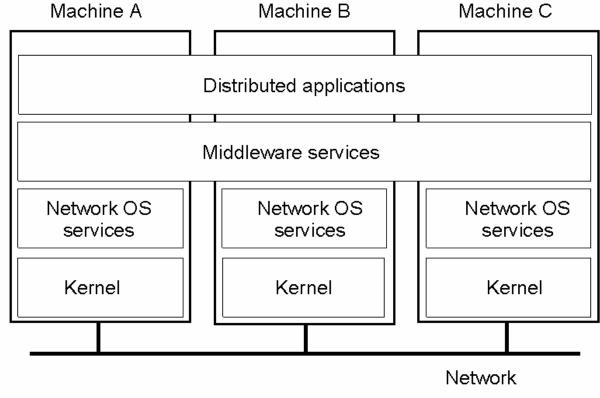

Employs a client-server model

- Minimal OS kernel
- Additional functionality as user processes

General structure of a distributed system as middleware

Thom	Distributed OS		Network	Middleware-	
Item	Multiproc.	Multicomp.	OS	based OS	
Degree of transparency	Very High	High	Low	High	
Same OS on all nodes	Yes	Yes	No	No	
Number of copies of OS	1	N	N	Ν	
Basis for communication	Shared memory	Messages	Files	Model specific	
Resource management	Global, central	Global, distributed	Per node	Per node	
Scalability	No	Moderately	Yes	Varies	
Openness	Closed	Closed	Open	Open
